Collaborative exercise: Artificial Intelligence & Academic Integrity Policy

Policy Regulation

Case Study #1

University X is a medium-sized university with a strong commitment to academic integrity. In recent years, the number of students using AI to complete their coursework has increased dramatically. This has prompted the university to investigate the potential implications of using AI for academic integrity.

The university began by considering the possible scenarios in which AI could be used to facilitate academic dishonesty. These included using AI to generate papers and essays, using AI to copy or manipulate data, and using AI to generate test answers. After considering the risks and potential benefits of using AI, the university concluded that it should be regulated to ensure that it was not used to violate the university's academic integrity policy.

As a group, complete the following activities:

1. Propose recommendations for addressing these concerns in the university's academic integrity policy
2. Identify other university policies (if any) that might require review in light of these technologies
3. Paste the first activity/task into ChatGPT https://chat.openai.com/chat
   a. Generate the response (or multiple responses) and copy and paste the response(s) to the Jamboard
   b. Evaluate the response(s)
   c. What are the strengths and limitations of the recommendations that ChatGPT generated?

Please use the Jamboard to record your answers. Enter the question – and your team's responses.
